

Ignition Coil

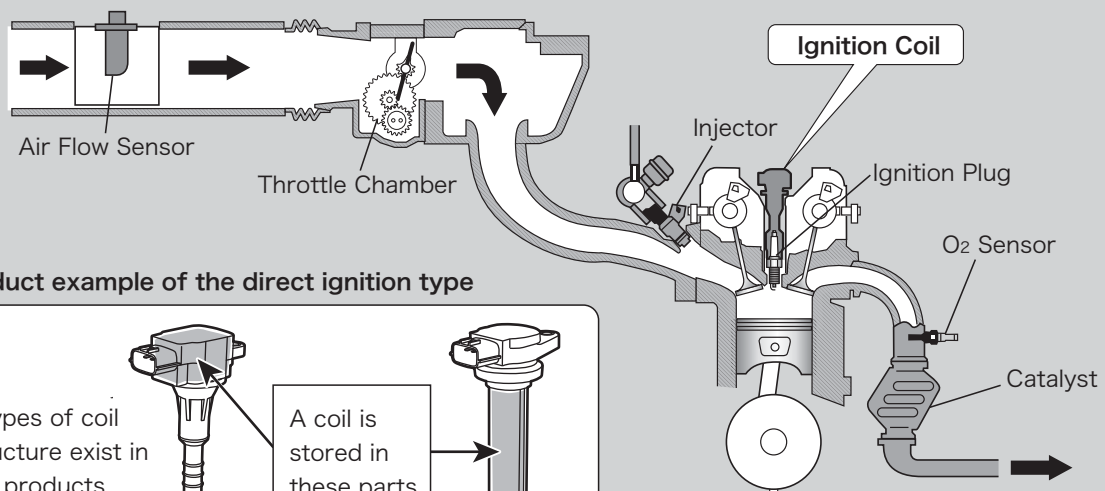

What is an Ignition Coil ?

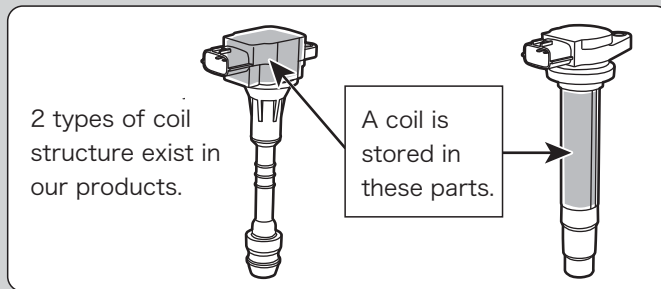

It is a device to generate high voltage for making spark discharge at the ignition plug.

An Ignition Coil is composed of a primary coil and a secondary coil which have different number of turns. When the current to the primary coil is cut off, high voltage is generated to the secondary coil by electromagnetic induction. In the past, high voltage generated at the Ignition Coil was distributed to ignition plugs of each cylinder through a distributor. In these days, direct ignition type which has no distributor became main stream. Since this type uses an ignition coil at the top of ignition plug of each cylinder, it is called as plug top type as well.

Product example of the direct ignition type

Typical failures and inspection methods

The life of an Ignition Coil depends largely on the environment in the engine room and the condition of the other secondary system parts and how it is treated in the maintenance.

Failures occur when the coil becomes old and the insulation becomes deteriorated.

The following troubles appear concerning the Ignition Coil:

- The engine speed does not increase or takes a breath in an acceleration,
- The idling condition becomes unstable or the engine stalls, or
- The engine becomes difficult to start while the battery and the starter motor are in normal condition.

As an inspection method the resistance between the terminals of the Ignition Coil is measured, to check the disconnection or short circuit of the coil.

Since the inspection method of the Ignition Coil depends on the maker of the vehicle, check the maintenance manual of the vehicle. If the failure occurs intermittently or it does not improve, it is recommended to replace the Ignition Coil.
